

TAURUS SCLEROTINIA UPDATE: April 2018

- Although not seen in crops every year, Sclerotinia can lead to yield losses of up to 60% when conditions favour the disease.
- The AHDB Sclerotinia Risk Alerts for 2018 are already showing that sites across the west, south and east are at high risk of disease development.
- When risk is high and the flowering period is prolonged, a two spray programme or robust mid-flowering spray, may be appropriate.
- TAURUS (containing thiophanate-methyl) can be a useful tool for the agronomist and grower, giving strong cost-effective Sclerotinia control alone, or in tank-mix with a product with a different mode of action.
- TAURUS can be used as part of a 2 spray programme alone at up to 0.71kg/Ha or in tank-mix at 0.5kg/Ha.
- Alternatively, if only one spray is planned mid-flower, TAURUS can be a very useful addition, giving good efficacy and helping with resistance management.
- For more information on use and tank-mixes, contact your local Certis advisor or call our technical helpline on 0845 373 0305.
- For more information about the Sclerotinia risk in your area, please visit:
